GEOGRAPHY

- Thermohaline circulation in the oceans is primarily driven by differences in:
 - Atmospheric pressure and wind speed
 - Ocean depth and tidal range
 - Temperature and salinity of seawater
 - Latitude and longitude
- Why are large subtropical oceanic gyres not centred directly over the Equator?
 - Ocean water is too warm at the Equator
 - The Coriolis effect becomes zero at the Equator
 - Salinity becomes uniform at the Equator
 - Equatorial tides prevent circular currents
- Coastal upwelling is most likely to occur when:
 - Surface water is transported towards the coast and sinks
 - Offshore Ekman transport removes surface water from the coast
 - Warm ocean water becomes less saline near the coast
 - Tidal currents completely stop near the continental shelf
- The relatively dry conditions on the leeward side of a mountain range are mainly caused by:
 - Greater evaporation caused by lower pressure
 - Continuous ascent and cooling of air
 - Descending air undergoing adiabatic warming
 - Strong ocean currents near the mountain slope
- Rapid uplift of land following the melting and retreat of a massive continental glacier is primarily associated with:
 - Isostatic rebound
 - Thermal subsidence
 - Continental drift
 - Eustatic adjustment
- Which combination best describes major western boundary currents such as the Gulf Stream and Kuroshio Current?
 - Cold, broad, shallow and equatorward
 - Cold, narrow, slow and poleward
 - Warm, narrow, fast and generally poleward
 - Warm, broad, slow and equatorward
- Which oceanic change is characteristically associated with the development of El Niño in the tropical Pacific?
 - Weakening of trade winds and suppression of eastern Pacific upwelling
 - Strengthening of trade winds and increased eastern Pacific upwelling
 - Strong cooling of the eastern Pacific with a shallower thermocline
 - Permanent reversal of the Pacific Ocean circulation
- A geostrophic wind develops when:
 - Frictional force completely balances gravity
 - Pressure-gradient force balances the Coriolis force
 - Centrifugal force balances surface friction
 - Coriolis force becomes zero
- A fjord is best described as:
 - A volcanic depression occupied by seawater
 - A river valley formed by lateral erosion
 - A tectonic rift submerged by the ocean
 - A deep, steep-sided glacial valley subsequently inundated by seawater
